This attempt took 9 minutes.

Question 1

5 / 5 pts

How do parameters make a function more reusable?

Your Answer:

A parameter in a functions allows it to be called somewhere in the program and by modifying the parameters, the programmer does not need to the program or the function. All that is needed is to change the parameters for the program to execute according to how the programmer wants it to.

Question 2**5 / 5 pts**

Describe a good function. In other words, answer this question: What differentiates a good function from a bad one?

Your Answer:

A good function is one that is efficient by being reusable. Functions need to be placed and called in a logical order for the program to run correctly. A good function takes in parameters, makes calculations and then at times returns a value accordingly. A good function performs one task and is usually not more than twenty lines. Good functions create building blocks for the entire program and allow others to easily read and understand the program.
